

Solution Deployment

Solutions and services you can trust

While implementing a cybersecurity solution is a complex undertaking for any Enterprise, those within critical infrastructure sectors face additional challenges.

Simply put: no one knows our products as well as us. The in-depth knowledge Professional Services provides translates to immediate ROI by ensuring your Enterprise harnesses the full power of OPSWAT solutions at launch.

OPSWAT understands regulatory compliance needs across industries, and our Professional Services experts make meeting these simple.

IT Staff is expensive. Time is valuable.

Skilled cybersecurity professionals are in both high demand and short supply, with positions difficult to fill.¹

At best, in-house deployment of new solutions requires your IT Staff to divert work hours to learning and evaluating fit with existing systems. At worst, hiring a cybersecurity professional with the necessary expertise for your business can itself present a problem.

According to the US Bureau of Labor Statistics, Information Security Analysts salaries range from a median of \$103k with an average of five years of experience, to a high end of \$163k.² Professional Services provides high-end experience for a fixed fee determined by your environment's specific needs.

Professional Services

Implementation

Even the best IT Professionals run into snags on the way to roll out when working with products they are unfamiliar with. While trial and error has its place, we don't believe that place is within critical production environments. There is no guesswork involved in Professional Services Solution Deployment.

We know our products. We learn your needs.

Tailored Solutions

OPSWAT knows one solution does not fit all, so we believe the best fit is a custom one. We are ready and willing to customize any offerings to suit customer business and regulatory compliance requirements.

Understanding the necessity for customization is reflected in our product development. For example, the MetaDefender Kiosk user interface is flexible to suit organization security needs. MetaAccess supports localization by supporting full customization of remediation pages.

Personalized Training

Training provided on OPSWAT Products are crafted specifically to your business needs and implemented design. We know effective training is aware of its audience. Comprehensive technical training for IT Staff to manage your OPSWAT products? We can do that. Simplified end user training for your OPSWAT Managed Services? We can do that, too.

Integration

OPSWAT didn't just pioneer multiscanning, which allows files to be scanned by over 30 anti-malware engines. We also wrote the book on compatibility in terms of access control and endpoint next-gen anti-malware, and disk encryption products with our [OPSWAT Access Control Certification Program](#).

We are no less devoted to compatibility within customer environments, an arena where expertise is often the difference between works for now and works seamlessly. Our technology partnerships ensure Professional Services is intimately familiar with the underlying challenges of third-party integration. These partnerships include, but are far from limited to VMWare for UAG, Okta and F5 for SSO, and SPLUINK for SIEM, and others: [OPSWAT Technology Partners](#)
