# Secure, Conditional Access Control for Users and Their Devices

Organizations must ensure that only authenticated users with compliant devices access secured networks. Orchestrating authentication and device compliance workflows for multiple applications and endpoints can be expensive and challenging. OPSWAT's MetaDefender Access Platform and Ping Identity's DaVinci provide an easy-to-use, customizable, zero-trust solution to ensure only authorized users with compliant devices access networks.

Together Ping Identity and OPSWAT provide identification and device compliance via the PingOne DaVinci platform. It enables custom access workflows for conditional authentication, ensuring compliance with enterprise policies.

The solution covers device compliance, vulnerability detection, patch management, and endpoint protection for secure zero-trust remote access.

Conditional access control
Apply conditional access based on the endpoint's security posture and the user's identity so only trusted devices and authenticated users can access sensitive resources.

Comprehensive compliance check
Enable the most comprehensive compliance checks to ensure endpoints meet regulatory requirements and security standards.

Seamless integration with PingOne DaVinci
Integrate endpoint compliance and security checks using no-code orchestration. Users can easily design secure and efficient workflows across the entire technology ecosystem.

Unified access management
Manage access across all devices and users, including organizational devices, BYOD devices, and third-party vendors.

Key Features

Thorough endpoint compliance
Goes beyond standard compliance checks such as encryption status, passwords, device health, geolocation, and granular app control with more than 1,000 certified security applications for Windows, macOS and Linux.

Advanced endpoint protection
Scans devices with over 20 antivirus engines, performs Deep CDR for files on removable media, protects user privacy with anti-keylogging, anti-screen capture, and block copy-paste functionality to prevent data loss.

Vulnerability detection
Detects over 90,000 vulnerabilities and KEVs across your endpoints.

Patch management
Assesses OS versions and over 700 third-party applications. Auto-patches over 150 third-party applications.

Benefits

Streamline access management
Increase operational efficiency and reduce costs with seamless implementation and no-code orchestration.

Enhance security
Device posture checking lowers the threat of unauthorized access and data breaches, resulting in potential cost savings for data recovery, legal expenses, and reputation damage.

Stay compliant
Thorough compliance checks adhere to industry regulations to mitigate non-compliance penalties and legal consequences, reducing risks of fines and maintaining reputation.

Elevate your access security with OPSWAT MetaDefender Access Platform and Ping Identity.
